

Bifacial power generation efficiency of photovoltaic panels

Overview

Bifaciality, also known as the bifacial factor or bifacial ratio, measures the ratio of the power generation capabilities of the back and front of bifacial modules under standard testing conditions, playing a vital role in evaluating the performance of bifacial solar panels. Bifacial solar panels offer several advantages over traditional solar panels. They generate electricity from both the front and rear, so they produce more energy in total. They tend to be more resilient because both sides are designed to resist environmental degradation due to UV and moisture.
