

# Electricity consumption caracas

## Overview

---

Primary energy consumption has rebounded since 2021 but remains 60% below its 2013 peak. Electricity generation is primarily hydro-powered, though production has fluctuated due to resource constraints. (Archive) Caracas, March 25, 2025 (venezuelanalysis. Energy Information Administration, International Energy Statistics; the International Energy Agency, World Energy Statistics 2022; and Energy Institute, Statistical Review of World Energy 2023 Note: Quads=quadrillion British thermal units. Other renewables include solar and wind. The immediate cause of the energy crisis was a prolonged drought that caused the water in the reservoir of the Simón Bolívar Hydroelectric Plant to reach very low levels. [1] Although various measures were taken to overcome the crisis, one of the most controversial was the implementation of a. In 2023, the landscape of electricity consumption in Venezuela is heavily dominated by low-carbon and hydropower energy sources. A striking majority, close to four-fifths of the electricity consumed, comes from low-carbon sources, almost exclusively hydropower, which makes up more than 78% of the. Electricity can be generated in two main ways: by harnessing the heat from burning fuels or nuclear reactions in the form of steam (thermal power) or by capturing the energy of natural forces such as the sun, wind or moving water.
