

# Emergency exhaust in the generator room

## Overview

---

WHEN EMERGENCY GENERATOR IS ENERGIZED SHALL OPEN. ROOM EXHAUST FAN SHALL BE INTERLOCKED WITH D3 & ROOM THERMOSTAT T1. WHEN ROOM THERMOSTAT RISES ABOVE 85°F [29°C] ROOM. A generator's ventilation system serves several critical functions: Heat Dissipation: Generators produce significant heat during operation. Without proper ventilation, this heat can damage internal components, reduce the system's lifespan, and create safety hazards. The association creates and publishes codes and standards that are published in separate documents. Each division has its own. Units located inside a building often require the exhaust to be routed up through the roof, up the side of the building, or to a free-standing stack. Generator exhaust systems for years have been fabricated from sections of schedule 40 carbon steel pipe that are field welded, then insulated to. A well-designed generator room supports safe, continuous power delivery under varying conditions. Here's why careful consideration matters. Ensures Safety A well-designed room accounts for spill containment, fire-rated construction, and proper separation between ignition sources and fuel.

## Emergency exhaust in the generator room

### 9.4.9 Emergency Power Generating Building Ventilation System

The exhaust air from the main tank room is directed through louver damper, exhaust fan, and a back draft damper. The exhaust air is then directed to the building exhaust through an outlet screen or grill.
