

Grounding on photovoltaic panels

Overview

The concept and purpose of grounding in DC systems, such as solar panels and photovoltaic arrays, are the same as in AC systems. However, the grounding process and methods differ slightly, offering multiple options, such as separate grounding or combined grounding. It is a mandatory practice required by NEC and IEC codes to protect both equipment and personnel from damage and electric shock hazards. It protects against electrical shocks, safeguards expensive equipment, and ensures stable performance. Grounding a solar photovoltaic (PV) system involves establishing a low-resistance conductive pathway that connects the non-current-carrying metal components of the array to the earth.
