

Mobile base station communication maintenance

Overview

To ensure stable communication between a base station and connect with the stability of mobile devices, it is necessary to check radio communication performance and eliminate radio wave whether or not radio interference and other obstacles when installing the base station exists. However, their construction, operation and maintenance, energy consumption, and security present numerous pain points, directly. Telecom base stations often operate in remote or unmanned locations and provide critical services such as mobile connectivity, internet access, and emergency communications. It usually connects the device to other networks or devices through a dedicated high bandwidth wire of fiber optic connection. Base stations typically have a transceiver, capable of sending and. The purpose of its maintenance work is to ensure that the communication equipment has continuous, stable, reliable energy, providing a normal operation of the communication device to ensure the safety of the system. In this regard, the maintenance personnel need to have certain professional skills.
