

Photovoltaic energy storage heating system

Overview

Hybrid solutions combine on-site solar generation (typically photovoltaics, PV) and storage (batteries or thermal tanks) with efficient thermal technologies (solar thermal collectors, phase-change materials, geothermal heat pumps, etc. The AES Lawai Solar Project in Kauai, Hawaii has a 100 megawatt-hour battery energy storage system paired with a solar photovoltaic system. Sometimes two is better than one. The reason: Solar energy is not always produced at the time. Buildings with electrified heat pump systems, onsite photovoltaic (PV) generation, and energy storage offer strong potential for demand flexibility. This study compares two storage configurations, thermal energy storage (TES) and battery energy storage (BESS), to evaluate their impact on cooling. As net-zero building goals gain momentum worldwide, integrating solar storage with thermal systems offers a powerful way to cut energy use and increase resilience. Photovoltaic (PV) devices generate electricity directly from sunlight via an electronic process that occurs naturally in certain types of material, called semiconductors.
