ESS

Overview

A solar cell is essentially a PN junction with a large surface area. Light travels in packets of energy called photons. What Exactly Is a PN. ctric current (Becquerel, 1839). At present, most solar cells are silicon-based, since this is the most mature technology. However, other materials are under active investigation and may. Many devices, including photovoltaic devices, LEDs, photodiodes, semiconductor lasers, and thermoelectric devices are essentially made from pn junctions. The N-type material is kept thin to allow light to pass through to the PN junction. Doping is adding a small number of atoms to a large number of another - for example, 1 boron atom in 10 silicon atoms.
