

Photovoltaic panels connected in series to the controller

Overview

Connecting your panels in series will increase the voltage level and keep the amperage the same. The reason why series connections are utilized with MPPT controllers is that MPPT Controllers actually are able to accept a higher voltage input, and still be able to charge your 12V or. Voltage Calculation is Critical for Safety: Series wiring adds voltages together, and temperature variations can push systems beyond safe limits. Always calculate maximum cold-weather voltage using temperature coefficients to ensure you stay within NEC's 600V limit for residential installations and. When panels are connected in series, shade on one panel can significantly reduce the output of the entire string - like one bad bulb affecting a whole string of Christmas lights. Parallel connections are more forgiving with shade since each panel operates more independently. This ensures safety, efficiency, and maximum energy output from your system. You can do that one of two ways (or a hybrid of both).
