This secondary grid protection can be provided by a device which controls two contactors connected in line with the grid and the inverter. It continuously monitors grid parameters such as voltage and frequency and automatically disconnects the system from the grid if a parameter is outside the. It is a safety feature called anti-islanding. You will see why this matters, how inverters do it, and what codes require. As solar PV systems become more integrated into commercial and industrial facilities, ensuring a robust protection system design is critical, not only for safety but also to prevent nuisance tripping. Here are the specific functions of relays in photovoltaic energy storage inverters: 1.
