

Solar inverters are large quantities

Overview

High-capacity solar inverters are specialized devices designed to manage and convert large amounts of direct current (DC) from solar panels into alternating current (AC) for use in high-demand applications. In building a first off-grid or hybrid solar system, one of the most common mistakes is choosing an inverter that is far larger than the actual battery and PV array can support. Unlike small residential systems, large C&I projects require detailed engineering to. Put simply, inverter oversizing refers to when you pair a solar panel array whose DC capacity exceeds the rated AC output capacity of your solar inverter. You're essentially giving the inverter more DC power to work with than it's nominally rated to handle. Get it wrong, and you'll either waste money on oversized equipment or lose precious energy production.
