

# Solar module operation single cell heats up

## Overview

---

Hotspotting occurs in photovoltaic (PV) modules when the operating current exceeds the short-circuit current of shaded or defective cells, causing them to work in a reverse bias state. Instead of generating power, the cells become a heat source. This comprehensive review delves into the intricate relationship between thermal effects and solar cell performance, elucidating the critical role that temperature plays in the overall efficacy of photovoltaic systems. The way solar cells are arranged to form a PV module, has a side-effect which physically affects the PV module. It is a typical degradation mode in PV modules. Hence, it is crucial to understand its origins and ways to mitigate for a smooth and efficient operation of the system. Temperature significantly impacts how efficiently your solar.

## Solar module operation single cell heats up

### Hot spot (photovoltaics)

In a photovoltaic (PV) module, a hot spot describes an over proportional heating of a single solar cell or a cell part compared to the surrounding cells. It is a typical degradation mode in PV modules.
