Solar panels installed on the roof of the community to generate electricity

Overview

Rooftop solar refers to solar panels installed directly on the roofs of residential, commercial, or industrial buildings. Community solar customers typically subscribe to—or in some cases own—a portion of the energy generated by a solar array, and receive an electric bill credit for electricity generated by their share of the community solar system. Community solar can be a great option for people who are unable to. Both rooftop and community solar can shrink your electricity costs and your carbon footprint, but they generally serve different groups of people. If you install solar at your home or business, you'll likely install a rooftop solar panel system. Instead of installing solar panels on your own property, you subscribe to a portion of a nearby solar farm managed by an energy provider like US Light. Market Growth Continues Accelerating: With over 4.
