Overview

Solar technology is evolving faster than ever. Among the latest innovations are perovskite-silicon hybrid solar cells, promising higher efficiency and lower costs. 2026 is set to be a landmark year, as these hybrid panels are expected to hit the commercial market for the first time. Department of Energy (DOE) Solar Energy Technologies Office (SETO) supports research and development projects that increase the efficiency and lifetime of metal-halide perovskite solar cells, speeding the commercialization of perovskite solar technologies and decreasing manufacturing. A perovskite solar cell (PSC) is a type of solar cell that includes a perovskite-structured compound, most commonly a hybrid organic-inorganic lead or tin halide-based material as the light-harvesting active layer. This breakthrough combines advanced materials science and physics to accelerate global solar energy adoption.

Overview Stability Advantages Materials used Processing Toxicity Physics Architectures

One big challenge for perovskite solar cells (PSCs) is the aspect of short-term and long-term stability. The traditional silicon-wafer solar cell in a power plant can last 20-25 years, setting that timeframe as the standard for solar cell stability. PSCs have great difficulty lasting that long [196]. The instability of PSCs is mainly related to environmental influence (moisture and oxygen), thermal stress and intrinsic stability of methylammonium-based perovskite, and formamidinium-based perovskite, heating under ap...
