

Solar power wireless transmission

Overview

The core of SBSP lies in Wireless Power Transmission (WPT), a technology that has seen remarkable advancements in recent years. The Wireless Power Transmission Project will explore how high powered radio waves could be used to beam electricity over distances. The Space Solar Power Demonstrator (SSPD-1), a prototype launched into orbit in January, has successfully demonstrated wireless power transfer in space and beamed detectable power to Earth. While Microwave Power Beaming. National Grid Electricity Distribution (NGED) has partnered with Space Solar to investigate the potential of distributing electricity without wires, as part of a new innovation project examining whether wireless transmission could support the electricity network in the UK.
