Overview

The easiest and fastest way to calculate PV string size and voltage drop is to use the Mayfield Design Tool. Our web-based calculator has data for hundreds of PV modules, inverters, and locations so you don't have to look up datasheets nor do manual calculations. When designing a solar PV system it's critical to know the minimum and maximum number of PV modules that can be connected in series, referred to as a string. PV modules produce more voltage in low temperatures and less voltage in high temperatures. Consult a professional for accuracy. Inverters typically have 4 main specifications that need to be met as to not void the warranty and for maximum performance: The module specifications that are used to string. A solar string inverter comes in the form of a sizable unit that you install on a wall near your solar PV array, or it can be a device you place on a rack. It's normally larger than micro-inverters or power optimizers, designed for installation on or near individual solar panels. Below are some guidelines to help design an efficient system.
