

Support communication base station battery energy storage system

Overview

Most telecom base stations use 48V battery systems, while some legacy or hybrid sites may have 24V configurations. Lithium systems can be integrated into these architectures with proper BMS and charge control, providing longer life, reduced weight, and lower maintenance. Users can use the energy storage system to discharge during load peak periods and charge from the grid during low load periods, reducing peak load demand and saving electricity. In such cases, energy storage systems play a vital role, ensuring the base stations remain unaffected by external power disruptions and maintain stable and efficient communication. Fuel generators are unsuitable for long-term use without. With the relentless global expansion of 5G networks and the increasing demand for data, communication base stations face unprecedented challenges in ensuring uninterrupted power supply and managing operational costs. 45V output meets RRU equipment.

Support communication base station battery energy storage system
