

The generator air inlet area is not enough

Overview

The wind can prevent the air intake louver from opening on start up. The air inlet must be capable of moving enough air through the room to provide the correct minimum CFM (cubic feet per minute) cooling for generator as specified by the generator's manufacturer. When a generator is installed and operated in an indoor environment, adequate ventilation for heat dissipation and combustion is required. When ever possible, face the generator. I'm building an enclosed generator shed and can't find answers to a few questions, the shed will be virtually airtight when completed (air intake and air exhaust aside) the engine exhaust gasses will exit through a separate double lined and insulated exhaust pipe, It's going to be tight getting. Whether you're running a portable generator during a power outage or managing a large standby unit for your business, ensuring adequate airflow can be the difference between smooth operation and costly malfunctions. For ulate the engine generator package to nufacturers ofer enclosed generator sets for outdoor installations.
