

# Three major components of electrochemical energy storage

## Overview

---

Every system contains three primary components: the anode, the cathode, and the electrolyte that separates them while facilitating ion movement. Electrochemical energy storage systems have the potential to make a major contribution to the implementation of sustainable energy. This chapter describes the basic principles of electrochemical energy storage and discusses three important types of system: rechargeable batteries, fuel cells and. Electrochemical capacitors (ECs), also known as supercapacitors or ultracapacitors, are typically classified into two categories based on their different energy storage mechanisms, i., electric double layer capacitors (EDLCs) and pseudocapacitors.
