

# Truss structure photovoltaic panel installation specifications

## Overview

---

This technical bulletin has been developed to establish compliance with the National Building Code of Canada; the CSA O86, Engineering design in wood and the TPIC design procedures when Solar Ready Truss Design Procedures presented in this document are followed. Roles and coordination with the Canadian Solar Industries Association (CanSIA). The Solar Ready Guidelines specify a number of design considerations and modifications builders can make to new attached and detached homes in preparation for the installation of a future solar thermal system or solar photovoltaic system. Environmental Protection Agency (EPA) to assist builders in designing and constructing homes equipped with a set of features that make the installation of solar energy systems after the completion of the home's. That whole system—the panels, the racks, the wiring—has to be engineered to survive. I mean, it needs to be safe and built to last. The way you design and bolt them down completely changes depending on the site. This can include the weight of the panels, mounting system, and other related equipment, as well as the condition of the existing roof system. It is the position of the TPIC technical committee that existing roof systems involving wood truss components, need to be analyzed by a qualified structural engineer to evaluate the structure's ability to support a new solar installation.
