

What unit is the energy storage value of lithium battery

Overview

Lithium-ion battery capacity is defined as the total amount of electrical energy that a battery can store and deliver. It is measured in ampere-hours (Ah) or milliampere-hours (mAh). Typical Li-ion cells achieve 150–250 Wh/kg and 350–700 Wh/L, outperforming lead-acid and nickel-based alternatives. Critical for portable, wearable, medical, and aerospace devices, where every gram counts. This measures energy per unit. LiMn_2O_4 is generally the best value for money, and is also better for the environment. Anode material The anode material is carbon based, usually with composition Li_0 . This lithium content is lower than would be ideal, however higher capacity carbons pose safety issues.
